Lecture 2: Data Structures

Data Structure Interfaces

- A data structure is a way to store data, with algorithms that support operations on the data
- Collection of supported operations is called an interface (also API or ADT) Abstract Data type
- Interface is a **specification**: what operations are supported (the problem!)
- Data structure is a **representation**: how operations are supported (the solution!)
- In this class, two main interfaces: Sequence and Set

Sequence Interface (L02, L07)

- Maintain a sequence of items (order is **extrinsic**)
- Ex: $(x_0, x_1, x_2, \dots, x_{n-1})$ (zero indexing)
- (use n to denote the number of items stored in the data structure)
- Supports sequence operations:

Container	build(X)	given an iterable x, build sequence from items in x
	len()	return the number of stored items
Static	iter_seq()	return the stored items one-by-one in sequence order
	get_at(i)	return the i^{th} item
	set_at(i, x)	replace the i^{th} item with x
Dynamic	<pre>insert_at(i, x)</pre>	add x as the i^{th} item
	delete_at(i)	remove and return the i^{th} item
	<pre>insert_first(x)</pre>	add x as the first item
	delete_first()	remove and return the first item
	insert_last(x)	add x as the last item
	delete_last()	remove and return the last item
Specia	al case interfaces:	remove and return the last item

insert_last(x) and delete_last() queue | insert_last(x) and delete_first()

Lecture 2: Data Structures

Set Interface (L03-L08)

- Sequence about extrinsic order, set is about intrinsic order
- Maintain a set of items having **unique keys** (e.g., item x has key x. key)
- (Set or multi-set? We restrict to unique keys for now.)
- Often we let key of an item be the item itself, but may want to store more info than just key
- Supports set operations:

Container	build(X)	given an iterable x, build sequence from items in x		
	len()	return the number of stored items		
Static	find(k)	return the stored item with key k		
Dynamic	insert(x)	add x to set (replace item with key x.key if one already exists)		
	delete(k)	remove and return the stored item with key k		
Order	iter_ord()	return the stored items one-by-one in key order		
	find_min()	return the stored item with smallest key		
	find_max()	return the stored item with largest key		
	find_next(k)	return the stored item with smallest key larger than k		
	find_prev(k)	return the stored item with largest key smaller than k		

• Special case interfaces:

dictionary set without the Order operations

• In recitation, you will be asked to implement a Set, given a Sequence data structure.

Array Sequence

- Array is great for static operations! get_at(i) and set_at(i, x) in $\Theta(1)$ time!
- But not so great at dynamic operations...
- (For consistency, we maintain the invariant that array is full)

• Then inserting and removing items requires:

- reallocating the array

- shifting all items after the modified item

copying ele size n to size nti will take o(n) time

	Operation, Worst Case $O(\cdot)$					
Data	Container	Static	Dynamic			
Structure	build(X)	get_at(i)	insert_first(x)	insert_last(x)	insert_at(i, x)	
		set_at(i,x)	delete_first()	delete_last()	delete_at(i)	
Array	n	1	n	n	n	

Carlt do insent (ast (x) in const time in static Avoray, even though seems like H, us size constant, the memory, even though in Avoray no shifting; e in memory shifting.

Lecture 2: Data Structures 3

Linked List Sequence John Dynamic Sequence operations

- Pointer data structure (this is **not** related to a Python "list")
- Each item stored in a **node** which contains a pointer to the next node in sequence
- Each node has two fields: node.item and node.next
- Can manipulate nodes simply by relinking pointers!
- Maintain pointers to the first node in sequence (called the head)
- Can now insert and delete from the front in $\Theta(1)$ time! Yay!
- (Inserting/deleting efficiently from back is also possible; you will do this in PS1)
- But now $get_at(i)$ and $set_at(i, x)$ each take O(n) time...:(

• Can we get the best of both worlds? Yes! (Kind of...)

	Operation, Worst Case $O(\cdot)$					
Data	Container	Static	Dynamic			
Structure	build(X)	get_at(i)	insert_first(x)	insert_last(x)	insert_at(i, x)	
		set_at(i,x)	delete_first()	delete_last()	delete_at(i)	
Linked List	n	n	1	n	n	

Dynamic Array Sequence

- Make an array efficient for **last** dynamic operations
- Python "list" is a dynamic array
- Idea! Allocate extra space so reallocation does not occur with every dynamic operation **a**
- Fill ratio: $0 \le r \le 1$ the ratio of items to space
- Whenever array is full (r = 1), allocate $\Theta(n)$ extra space at end to fill ratio r_i (e.g., 1/2)
- Will have to insert $\Theta(n)$ items before the next reallocation
- A single operation can take $\Theta(n)$ time for reallocation
- However, any sequence of $\Theta(n)$ operations takes $\Theta(n)$ time
- So each operation takes $\Theta(1)$ time "on average"

Amortized Analysis

- Data structure analysis technique to distribute cost over many operations
- Operation has amortized cost T(n) if k operations cost at most $\leq kT(n)$
- "T(n) amortized" roughly means T(n) "on average" over many operations
- Inserting into a dynamic array takes $\Theta(1)$ amortized time
- More amortization analysis techniques in 6.046!

Grometric Serter: Somirented around box term of a.s.) Cf. Ollark termoba.s

Dynamic Array Deletion

When to the description back? $\Theta(1)$ time without effort, yay!

theta(n) amortized means O(1) amortized time over whole operation Individual resizing at end may take O(n) time, but on average to insert each element takes O(1) time, (averaging over the operation sequence)

- However, can be very wasteful in space. Want size of data structure to stay $\Theta(n)$
 - Attempt: if very empty, resize to r = 1. Alternating insertion and deletion could be bad...
 - Idea! When $r < r_d$, resize array to ratio r_i where $r_d < r_i$ (e.g., $r_d = 1/4$, $r_i = 1/2$)
 - Then $\Theta(n)$ cheap operations must be made before next expensive resize
 - Can limit extra space usage to $(1+\varepsilon)n$ for any $\varepsilon>0$ (set $r_d=\frac{1}{1+\varepsilon}, r_i=\frac{r_d+1}{2}$)
 - Dynamic arrays only support dynamic **last** operations in $\Theta(1)$ time
 - Python List append and pop are amortized O(1) time, other operations can be O(n)!
 - (Inserting/deleting efficiently from front is also possible; you will do this in PS1)

	Operation, Worst Case $O(\cdot)$				
Data	Container	Static	Dynamic		
Structure	build(X)	get_at(i)	insert_first(x)	insert_last(x)	insert_at(i, x)
		set_at(i,x)	delete_first()	delete_last()	delete_at(i)
Array	n	1	n	n	n
Linked List	n	n	1	n	n
Dynamic Array	n	1	n	$1_{(a)}$	n
